One Very Long Question

1. Read the passage. Photosynthesis takes place mostly in the leaves, where chloroplasts capture light energy and use it to turn carbon dioxide and water into glucose and oxygen. The light-dependent reactions happen in the thylakoid membranes, and the Calvin cycle happens in the stroma. Photosynthesis takes place mostly in the leaves, where chloroplasts capture light energy and use it to turn carbon dioxide and water into glucose and oxygen. The light-dependent reactions happen in the thylakoid membranes, and the Calvin cycle happens in the stroma. Photosynthesis takes place mostly in the leaves, where chloroplasts capture light energy and use it to turn carbon dioxide and water into glucose and oxygen. The light-dependent reactions happen in the thylakoid membranes, and the Calvin cycle happens in the stroma. Photosynthesis takes place mostly in the leaves, where chloroplasts capture light energy and use it to turn carbon dioxide and water into glucose and oxygen. The light-dependent reactions happen in the thylakoid membranes, and the Calvin cycle happens in the stroma. Photosynthesis takes place mostly in the leaves, where chloroplasts capture light energy and use it to turn carbon dioxide and water into glucose and oxygen. The light-dependent reactions happen in the thylakoid membranes, and the Calvin cycle happens in the stroma. Photosynthesis takes place mostly in the leaves, where chloroplasts capture light energy and use it to turn carbon dioxide and water into glucose and oxygen. The light-dependent reactions happen in the thylakoid membranes, and the Calvin cycle happens in the stroma. Photosynthesis takes place mostly in the leaves, where chloroplasts capture light energy and use it to turn carbon dioxide and water into glucose and oxygen. The light-dependent reactions happen in the thylakoid membranes, and the Calvin cycle happens in the stroma. Photosynthesis takes place mostly in the leaves, where chloroplasts capture light energy and use it to turn carbon dioxide and water into glucose and oxygen. The light-dependent reactions happen in the thylakoid membranes, and the Calvin cycle happens in the stroma. Photosynthesis takes place mostly in the leaves, where chloroplasts capture light energy and use it to turn carbon dioxide and water into glucose and oxygen. The light-dependent reactions happen in the thylakoid membranes, and the Calvin cycle happens in the stroma. Photosynthesis takes place mostly in the leaves, where chloroplasts capture light energy and use it to turn carbon dioxide and water into glucose and oxygen. The light-dependent reactions happen in the thylakoid membranes, and the Calvin cycle happens in the stroma. Photosynthesis takes place mostly in the leaves, where chloroplasts capture light energy and use it to turn carbon dioxide and water into glucose and oxygen. The light-dependent reactions happen in the thylakoid membranes, and the Calvin cycle happens in the stroma. Photosynthesis takes place mostly in the leaves, where chloroplasts capture light energy and use it to turn carbon dioxide and water into glucose and oxygen. The light-dependent reactions happen in the thylakoid membranes, and the Calvin cycle happens in the stroma. Photosynthesis takes place mostly in the leaves, where chloroplasts capture light energy and use it to turn carbon dioxide and water into glucose and oxygen. The light-dependent reactions happen in the thylakoid membranes, and the Calvin cycle happens in the stroma. Photosynthesis takes place mostly in the leaves, where chloroplasts capture light energy and use it to turn carbon dioxide and water into glucose and oxygen. The light-dependent reactions happen in the thylakoid membranes, and the Calvin cycle happens in the stroma. Photosynthesis takes place mostly in the leaves, where chloroplasts capture light energy and use it to turn carbon dioxide and water into glucose and oxygen. The light-dependent reactions happen in the thylakoid membranes, and the Calvin cycle happens in the stroma. Photosynthesis takes place mostly in the leaves, where chloroplasts capture light energy and use it to turn carbon dioxide and water into glucose and oxygen. The light-dependent reactions happen in the thylakoid membranes, and the Calvin cycle happens in the stroma. Photosynthesis takes place mostly in the leaves, where chloroplasts capture light energy and use it to turn carbon dioxide and water into glucose and oxygen. The light-dependent reactions happen in the thylakoid membranes, and the Calvin cycle happens in the stroma. Photosynthesis takes place mostly in the leaves, where chloroplasts capture light energy and use it to turn carbon dioxide and water into glucose and oxygen. The light-dependent reactions happen in the thylakoid membranes, and the Calvin cycle happens in the stroma. Photosynthesis takes place mostly in the leaves, where chloroplasts capture light energy and use it to turn carbon dioxide and water into glucose and oxygen. The light-dependent reactions happen in the thylakoid membranes, and the Calvin cycle happens in the stroma. Photosynthesis takes place mostly in the leaves, where chloroplasts capture light energy and use it to turn carbon dioxide and water into glucose and oxygen. The light-dependent reactions happen in the thylakoid membranes, and the Calvin cycle happens in the stroma. Photosynthesis takes place mostly in the leaves, where chloroplasts capture light energy and use it to turn carbon dioxide and water into glucose and oxygen. The light-dependent reactions happen in the thylakoid membranes, and the Calvin cycle happens in the stroma. Photosynthesis takes place mostly in the leaves, where chloroplasts capture light energy and use it to turn carbon dioxide and water into glucose and oxygen. The light-dependent reactions happen in the thylakoid membranes, and the Calvin cycle happens in the stroma. Photosynthesis takes place mostly in the leaves, where chloroplasts capture light energy and use it to turn carbon dioxide and water into glucose and oxygen. The light-dependent reactions happen in the thylakoid membranes, and the Calvin cycle happens in the stroma. Which process does the passage describe?

Mark only one oval.

- Photosynthesis. Photosynthesis takes place mostly in the leaves, where chloroplasts capture light energy and use it to turn carbon dioxide and water into glucose and oxygen. The light-dependent reactions happen in the thylakoid membranes, and the Calvin cycle happens in the stroma. Photosynthesis takes place mostly in the leaves, where chloroplasts capture light energy and use it to turn carbon dioxide and water into glucose and oxygen. The light-dependent reactions happen in the thylakoid membranes, and the Calvin cycle happens in the stroma.
- Respiration. Photosynthesis takes place mostly in the leaves, where chloroplasts capture light energy and use it to turn carbon dioxide and water into glucose and oxygen. The light-dependent reactions happen in the thylakoid membranes, and the Calvin cycle happens in the stroma. Photosynthesis takes place mostly in the leaves, where chloroplasts capture light energy and use it to turn carbon dioxide and water into glucose and oxygen. The light-dependent reactions happen in the thylakoid membranes, and the Calvin cycle happens in the stroma.
- Digestion. Photosynthesis takes place mostly in the leaves, where chloroplasts capture light energy and use it to turn carbon dioxide and water into glucose and oxygen. The light-dependent reactions happen in the thylakoid membranes, and the Calvin cycle happens in the stroma. Photosynthesis takes place mostly in the leaves, where chloroplasts capture light energy and use it to turn carbon dioxide and water into glucose and oxygen. The light-dependent reactions happen in the thylakoid membranes, and the Calvin cycle happens in the stroma.
- Transpiration. Photosynthesis takes place mostly in the leaves, where chloroplasts capture light energy and use it to turn carbon dioxide and water into glucose and oxygen. The light-dependent reactions happen in the thylakoid membranes, and the Calvin cycle happens in the stroma. Photosynthesis takes place mostly in the leaves, where chloroplasts capture light energy and use it to turn carbon dioxide and water into glucose and oxygen. The light-dependent reactions happen in the thylakoid membranes, and the Calvin cycle happens in the stroma.

2. A short question after the long one: what gas do plants release?

Mark only one oval.

- Oxygen
- Nitrogen
- Helium
