Long Review: Sixty Questions

A long quiz that runs across many printed pages.

1. What is 1 × 3?

   Mark only one oval.

   - 0
   - 3
   - 6
   - 9

2. What is 2 × 3?

   Mark only one oval.

   - 3
   - 6
   - 9
   - 12

3. What is 3 × 3?

Mark only one oval.

- 6
- 9
- 12
- 15

4. What is 4 × 3?

Mark only one oval.

- 9
- 12
- 15
- 18

5. What is 5 × 3?

Mark only one oval.

- 12
- 15
- 18
- 21

6. What is 6 × 3?

Mark only one oval.

- 15
- 18
- 21
- 24

7. Question 7: Photosynthesis takes place mostly in the leaves, where chloroplasts capture light energy and use it to turn carbon dioxide and water into glucose and oxygen. The light-dependent reactions happen in the thylakoid membranes, and the Calvin cycle happens in the stroma. Photosynthesis takes place mostly in the leaves, where chloroplasts capture light energy and use it to turn carbon dioxide and water into glucose and oxygen. The light-dependent reactions happen in the thylakoid membranes, and the Calvin cycle happens in the stroma. Photosynthesis takes place mostly in the leaves, where chloroplasts capture light energy and use it to turn carbon dioxide and water into glucose and oxygen. The light-dependent reactions happen in the thylakoid membranes, and the Calvin cycle happens in the stroma. Which organelle is described?

   Mark only one oval.

   - Chloroplast
   - Mitochondrion
   - Nucleus
   - Ribosome

8. What is 8 × 3?

   Mark only one oval.

   - 21
   - 24
   - 27
   - 30

9. What is 9 × 3?

Mark only one oval.

- 24
- 27
- 30
- 33

10. What is 10 × 3?

Mark only one oval.

- 27
- 30
- 33
- 36

11. What is 11 × 3?

Mark only one oval.

- 33, because Photosynthesis takes place mostly in the leaves, where chloroplasts capture light energy and use it to turn carbon dioxide and water into glucose and oxygen. The light-dependent reactions happen in the thylakoid membranes, and the Calvin cycle happens in the stroma.
- 34, because Photosynthesis takes place mostly in the leaves, where chloroplasts capture light energy and use it to turn carbon dioxide and water into glucose and oxygen. The light-dependent reactions happen in the thylakoid membranes, and the Calvin cycle happens in the stroma.
- 32, because Photosynthesis takes place mostly in the leaves, where chloroplasts capture light energy and use it to turn carbon dioxide and water into glucose and oxygen. The light-dependent reactions happen in the thylakoid membranes, and the Calvin cycle happens in the stroma.

12. What is 12 × 3?

Mark only one oval.

- 33
- 36
- 39
- 42

13. What is 13 × 3?

Mark only one oval.

- 36
- 39
- 42
- 45

14. Question 14: Photosynthesis takes place mostly in the leaves, where chloroplasts capture light energy and use it to turn carbon dioxide and water into glucose and oxygen. The light-dependent reactions happen in the thylakoid membranes, and the Calvin cycle happens in the stroma. Photosynthesis takes place mostly in the leaves, where chloroplasts capture light energy and use it to turn carbon dioxide and water into glucose and oxygen. The light-dependent reactions happen in the thylakoid membranes, and the Calvin cycle happens in the stroma. Photosynthesis takes place mostly in the leaves, where chloroplasts capture light energy and use it to turn carbon dioxide and water into glucose and oxygen. The light-dependent reactions happen in the thylakoid membranes, and the Calvin cycle happens in the stroma. Which organelle is described?

Mark only one oval.

- Chloroplast
- Mitochondrion
- Nucleus
- Ribosome

15. What is 15 × 3?

Mark only one oval.

- 42
- 45
- 48
- 51

16. What is 16 × 3?

Mark only one oval.

- 45
- 48
- 51
- 54

17. What is 17 × 3?

Mark only one oval.

- 48
- 51
- 54
- 57

18. What is 18 × 3?

Mark only one oval.

- 51
- 54
- 57
- 60

19. What is 19 × 3?

Mark only one oval.

- 54
- 57
- 60
- 63

20. What is 20 × 3?

Mark only one oval.

- 57
- 60
- 63
- 66

21. Question 21: Photosynthesis takes place mostly in the leaves, where chloroplasts capture light energy and use it to turn carbon dioxide and water into glucose and oxygen. The light-dependent reactions happen in the thylakoid membranes, and the Calvin cycle happens in the stroma. Photosynthesis takes place mostly in the leaves, where chloroplasts capture light energy and use it to turn carbon dioxide and water into glucose and oxygen. The light-dependent reactions happen in the thylakoid membranes, and the Calvin cycle happens in the stroma. Photosynthesis takes place mostly in the leaves, where chloroplasts capture light energy and use it to turn carbon dioxide and water into glucose and oxygen. The light-dependent reactions happen in the thylakoid membranes, and the Calvin cycle happens in the stroma. Which organelle is described?

Mark only one oval.

- Chloroplast
- Mitochondrion
- Nucleus
- Ribosome

22. What is 22 × 3?

Mark only one oval.

- 66, because Photosynthesis takes place mostly in the leaves, where chloroplasts capture light energy and use it to turn carbon dioxide and water into glucose and oxygen. The light-dependent reactions happen in the thylakoid membranes, and the Calvin cycle happens in the stroma.
- 67, because Photosynthesis takes place mostly in the leaves, where chloroplasts capture light energy and use it to turn carbon dioxide and water into glucose and oxygen. The light-dependent reactions happen in the thylakoid membranes, and the Calvin cycle happens in the stroma.
- 65, because Photosynthesis takes place mostly in the leaves, where chloroplasts capture light energy and use it to turn carbon dioxide and water into glucose and oxygen. The light-dependent reactions happen in the thylakoid membranes, and the Calvin cycle happens in the stroma.

23. What is 23 × 3?

Mark only one oval.

- 66
- 69
- 72
- 75

24. What is 24 × 3?

Mark only one oval.

- 69
- 72
- 75
- 78

25. What is 25 × 3?

Mark only one oval.

- 72
- 75
- 78
- 81

26. What is 26 × 3?

Mark only one oval.

- 75
- 78
- 81
- 84

27. What is 27 × 3?

Mark only one oval.

- 78
- 81
- 84
- 87

28. Question 28: Photosynthesis takes place mostly in the leaves, where chloroplasts capture light energy and use it to turn carbon dioxide and water into glucose and oxygen. The light-dependent reactions happen in the thylakoid membranes, and the Calvin cycle happens in the stroma. Photosynthesis takes place mostly in the leaves, where chloroplasts capture light energy and use it to turn carbon dioxide and water into glucose and oxygen. The light-dependent reactions happen in the thylakoid membranes, and the Calvin cycle happens in the stroma. Photosynthesis takes place mostly in the leaves, where chloroplasts capture light energy and use it to turn carbon dioxide and water into glucose and oxygen. The light-dependent reactions happen in the thylakoid membranes, and the Calvin cycle happens in the stroma. Which organelle is described?

Mark only one oval.

- Chloroplast
- Mitochondrion
- Nucleus
- Ribosome

29. What is 29 × 3?

Mark only one oval.

- 84
- 87
- 90
- 93

30. What is 30 × 3?

Mark only one oval.

- 87
- 90
- 93
- 96

31. What is 31 × 3?

Mark only one oval.

- 90
- 93
- 96
- 99

32. What is 32 × 3?

Mark only one oval.

- 93
- 96
- 99
- 102

33. What is 33 × 3?

Mark only one oval.

- 99, because Photosynthesis takes place mostly in the leaves, where chloroplasts capture light energy and use it to turn carbon dioxide and water into glucose and oxygen. The light-dependent reactions happen in the thylakoid membranes, and the Calvin cycle happens in the stroma.
- 100, because Photosynthesis takes place mostly in the leaves, where chloroplasts capture light energy and use it to turn carbon dioxide and water into glucose and oxygen. The light-dependent reactions happen in the thylakoid membranes, and the Calvin cycle happens in the stroma.
- 98, because Photosynthesis takes place mostly in the leaves, where chloroplasts capture light energy and use it to turn carbon dioxide and water into glucose and oxygen. The light-dependent reactions happen in the thylakoid membranes, and the Calvin cycle happens in the stroma.

34. What is 34 × 3?

Mark only one oval.

- 99
- 102
- 105
- 108

35. Question 35: Photosynthesis takes place mostly in the leaves, where chloroplasts capture light energy and use it to turn carbon dioxide and water into glucose and oxygen. The light-dependent reactions happen in the thylakoid membranes, and the Calvin cycle happens in the stroma. Photosynthesis takes place mostly in the leaves, where chloroplasts capture light energy and use it to turn carbon dioxide and water into glucose and oxygen. The light-dependent reactions happen in the thylakoid membranes, and the Calvin cycle happens in the stroma. Photosynthesis takes place mostly in the leaves, where chloroplasts capture light energy and use it to turn carbon dioxide and water into glucose and oxygen. The light-dependent reactions happen in the thylakoid membranes, and the Calvin cycle happens in the stroma. Which organelle is described?

Mark only one oval.

- Chloroplast
- Mitochondrion
- Nucleus
- Ribosome

36. What is 36 × 3?

Mark only one oval.

- 105
- 108
- 111
- 114

37. What is 37 × 3?

Mark only one oval.

- 108
- 111
- 114
- 117

38. What is 38 × 3?

Mark only one oval.

- 111
- 114
- 117
- 120

39. What is 39 × 3?

Mark only one oval.

- 114
- 117
- 120
- 123

40. What is 40 × 3?

Mark only one oval.

- 117
- 120
- 123
- 126

41. What is 41 × 3?

Mark only one oval.

- 120
- 123
- 126
- 129

42. Question 42: Photosynthesis takes place mostly in the leaves, where chloroplasts capture light energy and use it to turn carbon dioxide and water into glucose and oxygen. The light-dependent reactions happen in the thylakoid membranes, and the Calvin cycle happens in the stroma. Photosynthesis takes place mostly in the leaves, where chloroplasts capture light energy and use it to turn carbon dioxide and water into glucose and oxygen. The light-dependent reactions happen in the thylakoid membranes, and the Calvin cycle happens in the stroma. Photosynthesis takes place mostly in the leaves, where chloroplasts capture light energy and use it to turn carbon dioxide and water into glucose and oxygen. The light-dependent reactions happen in the thylakoid membranes, and the Calvin cycle happens in the stroma. Which organelle is described?

Mark only one oval.

- Chloroplast
- Mitochondrion
- Nucleus
- Ribosome

43. What is 43 × 3?

Mark only one oval.

- 126
- 129
- 132
- 135

44. What is 44 × 3?

Mark only one oval.

- 132, because Photosynthesis takes place mostly in the leaves, where chloroplasts capture light energy and use it to turn carbon dioxide and water into glucose and oxygen. The light-dependent reactions happen in the thylakoid membranes, and the Calvin cycle happens in the stroma.
- 133, because Photosynthesis takes place mostly in the leaves, where chloroplasts capture light energy and use it to turn carbon dioxide and water into glucose and oxygen. The light-dependent reactions happen in the thylakoid membranes, and the Calvin cycle happens in the stroma.
- 131, because Photosynthesis takes place mostly in the leaves, where chloroplasts capture light energy and use it to turn carbon dioxide and water into glucose and oxygen. The light-dependent reactions happen in the thylakoid membranes, and the Calvin cycle happens in the stroma.

45. What is 45 × 3?

Mark only one oval.

- 132
- 135
- 138
- 141

46. What is 46 × 3?

Mark only one oval.

- 135
- 138
- 141
- 144

47. What is 47 × 3?

Mark only one oval.

- 138
- 141
- 144
- 147

48. What is 48 × 3?

Mark only one oval.

- 141
- 144
- 147
- 150

49. Question 49: Photosynthesis takes place mostly in the leaves, where chloroplasts capture light energy and use it to turn carbon dioxide and water into glucose and oxygen. The light-dependent reactions happen in the thylakoid membranes, and the Calvin cycle happens in the stroma. Photosynthesis takes place mostly in the leaves, where chloroplasts capture light energy and use it to turn carbon dioxide and water into glucose and oxygen. The light-dependent reactions happen in the thylakoid membranes, and the Calvin cycle happens in the stroma. Photosynthesis takes place mostly in the leaves, where chloroplasts capture light energy and use it to turn carbon dioxide and water into glucose and oxygen. The light-dependent reactions happen in the thylakoid membranes, and the Calvin cycle happens in the stroma. Which organelle is described?

Mark only one oval.

- Chloroplast
- Mitochondrion
- Nucleus
- Ribosome

50. What is 50 × 3?

Mark only one oval.

- 147
- 150
- 153
- 156

51. What is 51 × 3?

Mark only one oval.

- 150
- 153
- 156
- 159

52. What is 52 × 3?

Mark only one oval.

- 153
- 156
- 159
- 162

53. What is 53 × 3?

Mark only one oval.

- 156
- 159
- 162
- 165

54. What is 54 × 3?

Mark only one oval.

- 159
- 162
- 165
- 168

55. What is 55 × 3?

Mark only one oval.

- 165, because Photosynthesis takes place mostly in the leaves, where chloroplasts capture light energy and use it to turn carbon dioxide and water into glucose and oxygen. The light-dependent reactions happen in the thylakoid membranes, and the Calvin cycle happens in the stroma.
- 166, because Photosynthesis takes place mostly in the leaves, where chloroplasts capture light energy and use it to turn carbon dioxide and water into glucose and oxygen. The light-dependent reactions happen in the thylakoid membranes, and the Calvin cycle happens in the stroma.
- 164, because Photosynthesis takes place mostly in the leaves, where chloroplasts capture light energy and use it to turn carbon dioxide and water into glucose and oxygen. The light-dependent reactions happen in the thylakoid membranes, and the Calvin cycle happens in the stroma.

56. Question 56: Photosynthesis takes place mostly in the leaves, where chloroplasts capture light energy and use it to turn carbon dioxide and water into glucose and oxygen. The light-dependent reactions happen in the thylakoid membranes, and the Calvin cycle happens in the stroma. Photosynthesis takes place mostly in the leaves, where chloroplasts capture light energy and use it to turn carbon dioxide and water into glucose and oxygen. The light-dependent reactions happen in the thylakoid membranes, and the Calvin cycle happens in the stroma. Photosynthesis takes place mostly in the leaves, where chloroplasts capture light energy and use it to turn carbon dioxide and water into glucose and oxygen. The light-dependent reactions happen in the thylakoid membranes, and the Calvin cycle happens in the stroma. Which organelle is described?

Mark only one oval.

- Chloroplast
- Mitochondrion
- Nucleus
- Ribosome

57. What is 57 × 3?

Mark only one oval.

- 168
- 171
- 174
- 177

58. What is 58 × 3?

Mark only one oval.

- 171
- 174
- 177
- 180

59. What is 59 × 3?

Mark only one oval.

- 174
- 177
- 180
- 183

60. What is 60 × 3?

Mark only one oval.

- 177
- 180
- 183
- 186
